the study of operator algebras which grew out of von Neumann's work in the 1920s and the 1930s on modelling quantum mechanics has in recent years experienced tremendous growth and vitality this growth has resulted in significant applications in other areas both within and outside mathematics the field was a natural candidate for a 1994-1995 program year in operator algebras and applications held at the fields

institute for research in the mathematical sciences this volume contains a selection of papers that arose from the seminars and workshops of the program topics covered include the classification of amenable C^* algebras the baum connes conjecture E_0 semigroups subfactors E theory quasicrystals and the solution to a long standing problem in operator theory can almost commuting self adjoint matrices be approximated by commuting self adjoint matrices

this volume presents the proceedings from the research conference symbolic computation solving equations in algebra analysis and engineering held at mount holyoke college usa it provides an overview of contemporary research in symbolic computation as it applies to the solution of polynomial systems the conference brought together pure and applied mathematicians computer scientists and engineers who use symbolic computation to solve systems of equations or who develop the theoretical background and tools needed for this purpose within this general framework the conference focused on several themes systems of polynomials systems of differential equations noncommutative systems and applications

this book presents material from 3 survey lectures and 14 additional invited lectures given at the euroconference computational methods for representations of groups and algebras held at essen university in april 1997 the purpose of this meeting was to provide a survey of general theoretical and computational methods and recent advances in the representation theory of groups and algebras the foundations of these research areas were laid in survey articles by p dräxler and r nörenberg on classification problems in the representation theory of finite dimensional algebras r a wilson on construction of finite matrix groups and e green on noncommutative gröbner bases and projective resolutions furthermore new applications of the computational methods in linear algebra to the revision of the classification of finite simple sporadic groups are presented computational tools including high performance computations on supercomputers have become increasingly important for classification problems they are also inevitable for the construction of projective resolutions of finitely generated modules over finite dimensional algebras and the study of group cohomology and rings of invariants a major part of this book is devoted to a survey of algorithms for computing special examples in the study of grothendieck groups quadratic forms and derived categories of finite dimensional algebras open questions on lie algebras bruhat orders coxeter groups and kazhdan lusztig polynomials are investigated with the aid of computer programs the contents of this book provide an overview on the present state of the art therefore it will be very useful for graduate students and researchers in mathematics computer science and physics

these proceedings are from the tenth international conference on representations of algebras and related topics icra x held at the fields institute in addition to the traditional instructional workshop preceding the conference there were also workshops on commutative algebra algebraic geometry and representation theory finite dimensional algebras algebraic groups and lie theory and quantum groups and hall algebras these workshops reflect the latest developments and the increasing interest in areas that are closely related to the representation theory of finite dimensional associative algebras although these workshops were organized separately their topics are strongly interrelated the workshop on commutative algebra algebraic geometry and representation theory surveyed various recently established connections such as those pertaining to the classification of vector bundles or cohen macaulay modules over noetherian rings coherent sheaves on curves or ideals in weyl algebras in addition methods from algebraic geometry or commutative algebra relating to quiver representations and varieties of modules were

presented the workshop on finite dimensional algebras algebraic groups and lie theory surveyed developments in finite dimensional algebras and infinite dimensional lie theory especially as the two areas interact and may have future interactions the workshop on quantum groups and hall algebras dealt with the different approaches of using the representation theory of quivers and species in order to construct quantum groups working either over finite fields or over the complex numbers in particular these proceedings contain a quite detailed outline of the use of perverse sheaves in order to obtain canonical bases the book is recommended for graduate students and researchers in algebra and geometry
