and the moon

Experiment 3 Measuring the Sun's Altitude

Objective To determine the sun's altitude at different times of the day and understand the relationship between altitude and the length of shadows

Procedure This experiment likely involves measuring the angle of the sun above the horizon using a protractor or inclinometer at different times of the day

Answers

Solar Altitude The sun's altitude is its angle above the horizon. This angle changes throughout the day, reaching its highest point at solar noon.

Shadow Length The length of shadows cast by objects depends on the sun's altitude. As the sun rises higher, the shadows become shorter.

Seasonal Variation The sun's altitude also varies throughout the year due to the Earth's tilt on its axis. This variation results in the changing length of days and nights throughout the year.

Experiment 4 Simulating the Seasons

Objective To understand the cause of seasons on Earth by replicating the Earth's tilt and its orbit around the sun

Procedure This experiment likely involves using a model of the Earth and a light source to represent the sun. By adjusting the Earth's tilt and position relative to the light source, the experiment simulates the changing seasons.

Answers

Earth's Tilt The Earth's tilt on its axis is the primary cause of seasons. This tilt causes different hemispheres to receive varying amounts of direct sunlight throughout the year.

3 Solstices and Equinoxes

Solstices mark the points of maximum tilt towards or away from the sun, leading to the longest and shortest days of the year. Equinoxes occur when the sun is directly above the equator, resulting in equal day and night lengths.

Seasonal Variations The changing angle of sunlight influences the amount of heat received by different parts of the Earth, leading to variations in temperature and weather patterns.

Experiment 5 Calculating Star Distances

Objective To explore methods for estimating the distances to stars using parallax measurements

Procedure This experiment likely involves simulating the parallax effect using a model of a star and a telescope. By observing the apparent shift of the star against a distant background, the experiment demonstrates the principle of parallax.

Answers

Parallax Parallax is the apparent shift in an object's position when viewed from two different locations. This shift is greater for closer objects.

Star Distances By measuring the parallax of a star, astronomers can calculate its distance from Earth.

Units of Distance Astronomers use units like lightyears and parsecs to measure the vast distances between stars.

Conclusion Astronomy Through Practical Investigations No 26 provides a stimulating exploration of astronomical concepts, allowing students to engage in hands-on learning experiences. By conducting these experiments and understanding the answers, students can gain a deeper appreciation for the intricacies of our universe. From understanding the movement of stars to exploring the causes of seasons, these

investigations foster curiosity and inspire further exploration of the cosmos The knowledge gained from these practical investigations can serve as a foundation for future inquiries into the mysteries of the universe
