digital systems engineering presents a comprehensive treatment of speed reliability and power

all structures suffer from stresses and strains caused by factors such as wind loading and vibrations stress analysis and measurement is an integral part of the design and management of structures and is used in a wide range of engineering areas there are two main types of stress analyses the first is conceptual where the structure does not yet exist and the analyst has more freedom to define geometry materials loads etc generally such analysis is undertaken using numerical methods such as the finite element method the second is where the structure or a prototype exists and so some parameters are known others though such as wind loading or environmental conditions will not be completely known and yet may profoundly affect the structure these problems are generally handled by an ad hoc combination of experimental and analytical methods this book therefore tackles one of the most common challenges facing engineers how to solve a stress analysis problem when all of the required information is not available its central concern is to establish formal methods for including measurements as part of the complete analysis of such problems by presenting a new approach to the processing of experimental data and thus to experimentation itself in addition engineers using finite element methods will be able to extend the range of problems they can solve and thereby the range of applications they can address using the methods developed here modern experimental stress analysis presents a comprehensive and modern reformulation of the approach to processing experimental data offers a large collection of problems ranging from static to dynamic linear to non linear covers stress analysis with the finite element method includes a wealth of documented experimental examples provides new ideas for researchers in computational mechanics

this volume contains six papers discussing coastal processes and physical and numerical modeling in the first paper svendsen and putrevu give an extensive review on the state of understanding of surf zone hydrodynamics including subjects such as wave breaking wave induced currents and instability of nearshore currents and infragravity waves they point out that the most urgent need is to develop an adequate theory for wave breaking and broken waves in the surf zone one of the methods for studying the complex coastal processes is to perform laboratory experiments however physical models are always plagued by scale and laboratory effects because the coastal process involves many different length and time scales in the second paper kamphuis presents a detailed discussion on the sources and implications of the scale and laboratory effects on physical modeling the third and the fourth papers are two parts of the discussion on the mathematical modeling of the meso tidal barrier island coasts to understand the dynamics of coastal inlet systems one can either rely on empirical knowledge and construct various forms of empirical and semi empirical models part i or develop a set of mathematical models based on the physical processes part ii although these models do not provide the details of the dynamics they give valuable knowledge of the equilibrium state relationships de vriend and ribberink give a detailed review on two models initial sedimentation erosion models and medium term morphodynamic models they have also presented many examples of applications in the fifth paper houston gives a brief review on different methods to mitigate beach loss caused by storms or persistent long term erosion he then describes in detail the method of beach nourishment which is also called a beach fill this paper discusses the

information that must be collected to design a beach fill and that should be monitored after the completion of the project the last paper of this volume shifts our attention to the design of offshore structures such as gravity structures floating barges and tankers chakrabarti discusses the effects of the uniform and shear currents on fixed and floating structures
