stephen marshak s bestselling text and media make geology easy for students to understand

this book provides a case study on how to design and build an introductory geology course for non science majors the book presents a foundation with the status of geoscience education

and research in geoscience conceptual development as a backdrop for the design process it then describes the instructional goal setting process and development of the structural components of the course based on the determined goals the book presents the three historical narratives the earth is a historical entity the earth is very old and the earth is dynamic that form the foundation of instruction it also describes examples of the implicit explicit and reflective treatments of the nature of science to help student develop a better sense of the process of geology finally the book gives preliminary results from some innovative approaches to research on student learning within the domains of geological content knowledge and nos content knowledge within the course

this edited book discusses various challenges in teaching structural geology and tectonics and how they have been overcome by eminent instructors who employed effective and innovative means to do so all of the chapters were written by prominent and active academics and geoscientists fully engaged in teaching structural geology and tectonics new instructors will find this book indispensable in framing their teaching strategy effective teaching of structural geology and tectonics constitutes the backbone of geoscience education teaching takes place not only in classrooms but also in labs and in the field the content and teaching methodologies for these two fields have changed over time shaped by the responsibilities that present day geoscientists are expected to fulfill

defending society against natural hazards is a high stakes game of chance against nature involving tough decisions how should a developing nation allocate its budget between building schools for towns without ones or making existing schools earthquake resistant does it make more sense to build levees to protect against floods or to prevent development in the areas at risk would more lives be saved by making hospitals earthquake resistant or using the funds for patient care what should scientists tell the public when as occurred in L'Aquila Italy and Mammoth Lakes California there is a real but small risk of an upcoming earthquake or volcanic eruption recent hurricanes earthquakes and tsunamis show that society often handles such choices poorly sometimes nature surprises us when an earthquake hurricane or flood is bigger or has greater effects than expected from detailed hazard assessments in other cases nature outsmarts us doing great damage despite expensive mitigation measures or causing us to divert limited resources to mitigate hazards that are overestimated much of the problem comes from the fact that formulating effective natural hazard policy involves combining science economics and risk analysis to analyze a problem and explore the costs and benefits of different options in situations where the future is very uncertain because mitigation policies are typically chosen without such analysis the results are often disappointing this book uses general principles and case studies to explore how we can do better by taking an integrated view of natural hazards issues rather than treating the relevant geoscience engineering economics and policy formulation separately thought provoking questions at the end of each chapter invite readers to confront the complex issues involved readership instructors researchers practitioners and students interested in geoscience engineering economics or policy issues relevant to natural hazards suitable for upper level undergraduate or graduate courses additional resources can be found at wiley.com/go/stein_playing_against_nature

when author George Davis conceptualized the cover illustration for the first edition of Structural Geology of Rocks and Regions he wanted to emphasize that the human adventure of learning comes from doing and that new insight springs from careful detailed examination of field relationships viewed at all scales from rocks to regions he asked illustrator David Fisher to combine four photos into the single painting you see here the geologist is enveloped by challenging structural relationships of folded rocks in outcrop the curvature of back and neck torqued as eyes and brain move closer and closer to clipboard is the classic language of geologic mapping when George Davis and new co author Steve Reynolds contemplated the cover illustration for the second edition of Structural Geology of Rocks and Regions they asked who else is in the picture stepping back and handing David Fisher a couple of additional photos the scene suddenly changed the original geologist who had been sitting on the outcrop recording data is now up and walking around gathering new data a second geologist has moved into the new foreground mapping and sketching a system of small scale imbricate faults again the head is torqued to handle the requirements of fine description and careful mapping like so many structural geologists she seems to thrive on visualization of three dimensional relationships
