this volume contains the main papers presented at the 1997 eurotox congress Århus denmark 24 28 june 1997 diversification in toxicology is seen as the application of basic science to such diverse areas as man and his environment the pressing issues which have been dealt with not only include reproductive effects of environmental chemicals xenoestrogens but also receptor

mediated toxic responses new frontiers in human and ecological toxicology chemoprevention of cancer and molecular approaches in toxicological research the practical and ethical facets of toxicology e g ecotoxicological risk assessment biomarkers of exposure complex chemical mixtures as well as animal welfare and the ethics of animal experimentation are also treated

in the laboratory testing the toxic effects for a single compound is a straightforward process however many common harmful substances occur naturally as mixtures and can interact to exhibit greater toxic effects as a mixture than the individual components exhibit separately complex mixtures addresses the problem of identifying and classifying complex mixtures investigating the effect of exposure and the research problems inherent in testing their toxicity to human beings a complete series of case studies is presented including one that examines the cofactors of alcohol consumption and cigarette smoke

this volume contains the papers presented at a meeting held in december 1985 to review the conduct and use of long and short term assays for the detection of chemical carcinogens the meeting was attended by about 60 experts in the fields of carcinogenesis mutagenesis and cell biology the series of reports on long term carcinogenicity assays pay particular attention to three topics the role of pharmacokinetic data early preneoplastic lesions in carcinogenesis and the possibility for discerning the relative contribution of carcinogens to various stages of carcinogenesis the reports on short term assays summarize among other points the principle and scientific basis of each assay and its relevance to carcinogen detection and to the multistage process of carcinogenesis

in recent years there has been a convergence of trends in chemical reaction engineering and chemistry which have set the stage for significant advances in kinetic and thermodynamic modeling of processes new analytical chemistry methods new mathematical methods and new computational tools facilitate a more fundamental approach and a deeper understanding of chemical reactions in complex mixtures with very large numbers of compounds such as petroleum fractions this fortunate state of affairs has stimulated important new work both in academia and industrial research labs the purpose of the workshop that led to this book was to bring together researchers at the forefront of this field to review the state of the art stimulate communication and cooperation between industry and academia and develop a cohesive picture of research trends and future directions the chapters of the book have been organized into four main areas continuous mixtures where the very large numbers of discrete compounds present are regarded as making up a continuum structure activity relationships where the nature and rates of the reactions that a particular molecule undergoes are correlated with its chemical

structure thus allowing the kinetics of very large numbers of compounds to be described by a few parameters kinetic analysis where mathematical techniques are applied to analyze the behavior of kinetic networks and thermodynamics emphasizing the practical and computational aspects of chemical equilibrium in complex mixtures
